

Additional Product Decisions Before Development

Offline / Bad Internet Behavior

The MVP should assume internet is needed for login, syncing, photo upload, and export.

For version 1, full offline mode is not required.

If internet is unavailable, the app should show a clear message:

- "You are offline. Data cannot be synced right now."
- "Photo upload failed. Try again."

Do not build complex offline sync in MVP unless specifically requested later.

App Language

The first version should support English UI by default.

The app should be designed so Serbian UI can be added later.

Voice input should support:

- Serbian: sr-RS
- English: en-US

The user should be able to choose preferred voice language in settings/profile.

Doctor-Patient Linking

For MVP, doctor-patient linking can be manually created in Supabase.

Do not build invite codes in the first implementation unless there is time.

Later version can add:

- Doctor creates invite code
- Patient enters invite code
- doctor_patient_access row is created automatically

Patient Privacy and Access

Patient owns their own data.

Doctor can only read data from linked patients.

Doctor should not edit/delete patient-created entries in MVP.

Doctor notes should be stored separately from patient entries.

Image Rules

All photos must be standardized before upload.

Rules:

- Do not upload original full-resolution image.
- Resize max width to 1280px.
- Keep aspect ratio.
- Compress as JPEG quality 0.8.
- Generate thumbnail.
- Store image metadata.
- Upload to private Supabase Storage.
- Store only paths/metadata in database.

Voice Input Rules

Voice input is a reusable text input helper.

It should:

- Work across all text fields.
- Append transcript to existing text.
- Let the user edit transcript before saving.
- Never save raw audio.
- Never use paid transcription API in MVP.
- Fall back to manual typing if recognition is unavailable.
- Support Serbian and English recognition where the device/browser allows it.

Export Rules

The database stores rows.

Exports generate JSON packages on demand.

Support export by:

- Selected day
- Selected week
- Selected month

Export modes:

- Photos only
- Photos + text
- Full data

JSON should include:

- patient code
- date range

- entries sorted by timestamp
- entry type
- title
- notes if selected
- custom fields
- photo metadata
- signed photo URLs when needed

Do not embed base64 images inside JSON.

Backup / Archive

Because Supabase free storage is limited, add a future plan for archive/export.

MVP should support monthly export.

Later, allow old months to be downloaded and optionally deleted from Supabase Storage to free space.

Data Deletion

MVP should include a basic delete-data plan.

At minimum:

- Patient can delete own entries.
- Patient can delete own photos attached to entries.
- Future version should include full account/data deletion.

MVP Definition of Done

Version 1 is considered done when:

1. User can sign up/log in.
2. Patient can create a timestamped entry.
3. Patient can attach a compressed photo.
4. Patient can use voice input where supported.
5. Patient can view daily timeline.
6. Doctor can view linked patient timeline.
7. Doctor can export selected day/month JSON.
8. Supabase RLS protects user data.
9. App runs on Android APK.
10. App runs as a web app.
11. Basic Huawei Android test is performed if a Huawei device is available.

First Development Slice

The first working slice should be:

Login → Patient daily timeline → Add text entry → Save to Supabase → Read from Supabase → Display on timeline.

Only after this works should Codex add photos, voice, doctor dashboard, and exports.

Testing Plan

Test with:

- One patient account
- One doctor account
- One account with bad/empty data
- Android phone
- Huawei phone if available
- Web browser

Test cases:

- Create entry
- Edit timestamp
- Delete entry
- Add photo
- Confirm photo compression
- Use voice input
- Voice unavailable fallback
- Doctor views linked patient
- Doctor cannot view unlinked patient
- Export day JSON
- Export month JSON
